

I am adamantly opposed to HD radio due in totality to the interference it causes on adjacent channels. AM and FM HD radio dramatically reduce the coverage of previously audible stations. I ask you to wait until a system is developed that causes zero additional interference to existing analog operations. With the commission adopting the NRSC standard in 1989 which reduced adjacent channel interference on AM, I am dumbfounded that a technology which creates infinitely greater interference to neighboring stations has even been considered. The interference this system creates is a disgrace to the American system of broadcasting and should be silenced immediately.
